

Restricted to the +30% latency band. The grouped GEMM's own optimum (1050 MHz) falls at 1.314x, just outside, so the budget costs 1 percentage point of energy -- 31.2% instead of 32.2%. The second domain's contribution is the (b) curve: biggest at the tight end where the single clock cannot fall, shrinking to nothing once the budget lets it reach the knee. Band is the 10th-90th percentile over 16 layer-samples; the swing is the tile-count sawtooth. Predicted, not measured.
